# Remy Class IV Laser For Onychomycosis (Toenail Fungus)

## Remy Class IV Laser for Pain Management

When the laser is placed against the skin, the photons of light penetrate deeply into tissue and accelerate cellular reproduction and growth.

This energy results in the restoration of normal cell function at an enhanced rate. Formation of new capillaries speeds up the healing process, reduces scar tissue, and alleviates inflammation.

## Fungal nails affect millions of people

More than a cosmetic issue, if left untreated it can lead to bigger complications such as:

- Infection to other toenails
- Infecting friends & family
- Increasing pain
- Ingrown nails

Individuals with diabetes are more susceptible to fungal nail due to compromised immune systems.

Laser therapy offers an effective, safe option for treating fungal toenails without the unwanted side effects of many oral medications.
